Formulating the future™

INNOVOX®

**Use 20% Less Product for
Superior Moisture Control**

with Industry-Leading Desiccant Innovox

Use 20% Less Product for Superior Moisture Control

with Industry-Leading Desiccant Innovox

Eliminate porosity, visible specks and surface blisters in your rubber and polymer compounds with Innovox microfine calcium oxide powders and granules.

Innovox uses high-quality calcium oxide, mined and produced on-site at our UK headquarters for a purer, more effective final product.

Thanks to an ultrafine particle size, Innovox disperses quickly and evenly, for superior cross-link density and higher strength. And due to Innovox's purity, it scavenges more acid. Innovox delivers exceptional product performance and eliminates visible specks or imperfections in the final product.

Proven Results

Proven by independent testers to require 20% less product for industry-leading results

Leading Purity

No visible specks or lumps in the final product thanks to industry-leading purity

Better Dispersion

Ultrafine consistency means a higher surface area and better dispersion

Improve Strength

Improves strength and compound curing while binding moisture

Reduce Levels

Reduce addition levels and stockholding while maintaining productivity

Available Now!

Who Are We?

For 20 years, Birch Chemicals has been delivering unrivalled products to the rubber and plastics industries. Because we produce and refine all of our raw materials on site, we guarantee the high quality, consistency and traceability our customers have come to expect from us.

We're dedicated to innovation: that's why our Innovation Centres are consistently finding new ways to improve our products, lead times and formulas. And thanks to our global distribution network, Innovox and other Birch Chemicals products are available worldwide.
